Answer **all** the questions.

- 1 (a) Define a *vector quantity*.

.....
..... [1]

- (b) Circle all the vector quantities in the list below.

acceleration speed time displacement weight [1]

- (c) Fig. 1.1 shows graphs of velocity v against time t for two cars **A** and **B** travelling along a straight level road in the same direction.

Fig. 1.1

At time $t = 0$, both cars are side-by-side.

- (i) Describe the motion of car **A** from $t = 0$ to $t = 10$ s.

.....
.....
..... [2]

2

- (ii) Calculate the distance travelled by car **A** in the first 4.0s.

distance = m [2]

- (iii) Use Fig. 1.1 to find

- 1 the time at which both cars have the same velocity

time = s [1]

- 2 the time t at which car **A** overtakes car **B**.

t = s [2]

[Total: 9]

2 Fig. 2.1 shows the path of water from a hose pipe.

Fig. 2.1

The end of the horizontal hose pipe is at a height of 1.3 m from the ground. The initial horizontal velocity of the water is 7.0 m s^{-1} . The horizontal distance from the end of the hose pipe to the point where the water hits the ground is 3.6 m. You may assume that air resistance has negligible effect on the motion of the water jet.

(a) On Fig. 2.1, draw an arrow to show the direction of the acceleration of the water at point **P**. (Mark this arrow **A**). [1]

(b) Describe the energy conversion that takes place as the water travels from the end of the hose pipe to the ground.

In your answer, you should use appropriate technical terms, spelled correctly.

.....

.....

.....

..... [2]

(c) Explain why the horizontal component of the velocity remains constant at 7.0 m s^{-1} .

.....

..... [1]

4

- (d) Show that the water takes about 0.5 s to travel from the end of the pipe to the ground.

[1]

- (e) Show that the speed of the water when it hits the ground is 8.6 ms^{-1} .

[3]

[Total: 8]

- 3 (a) Define the *newton*.

.....
 [1]

- (b) State why the equation ' $F = ma$ ' cannot be applied to particles travelling at speeds very close to the speed of light.

.....
 [1]

- (c) Fig. 3.1 shows the horizontal forces acting on a car of mass 900 kg when it is travelling at a particular velocity on a level-road.

Fig. 3.1

The total forward force between the tyres and the road is 200 N and the air resistance (drag) is 80 N.

- (i) Calculate the acceleration of the car.

acceleration = ms^{-2} [2]

- (ii) Explain why we cannot use the equation $v = u + at$ to predict the velocity of the car at a later time even when the forward force is constant.

.....
 [1]

6

(d) Fig. 3.2 shows a person being lifted vertically upwards by a rope.

Fig. 3.2

The mass of the person is 72 kg. The upward vertical acceleration of the person is 1.4 ms^{-2} . Calculate the tension T in the rope.

$T = \dots\dots\dots \text{ N [3]}$

[Total: 8]

Turn over

- 4 (a) Define *torque of a couple*.

.....
 [1]

- (b) Explain why *moment of a force* and *torque of a couple* have the same unit N m.

.....
 [1]

- (c) Fig. 4.1 shows an irregular shaped metal plate of constant thickness that can swing freely about point **P**.

Fig. 4.1

- (i) The weight of the plate is 6.0 N. With the plate in the position as shown in Fig. 4.1, calculate the clockwise moment of the weight of the plate about an axis through point **P**.

moment = N m [1]

- (ii) Explain why the moment of the weight reduces to zero when the plate reaches the bottom of the swing.

.....
 [1]

- (d) Describe an experiment to determine the centre of gravity of the metal plate shown in Fig. 4.1.

.....

.....

.....

.....

..... [3]

- (e) Fig. 4.2 shows a section of the human forearm in equilibrium.

Fig. 4.2

The weight of the object in the hand is 60 N. The centre of gravity of this object is 32 cm from the elbow. The bicep provides an upward force of magnitude F . The distance between the line of action of this force and the elbow is 3.5 cm. The weight of the forearm is 18 N. The distance between the centre of gravity of the forearm and the elbow is 14 cm.

By taking moments about the elbow, determine the magnitude of the force F provided by the bicep.

$F = \dots\dots\dots$ N [3]

.....
.....
..... [4]

[Total: 9]

- 7 (a) In what form is energy stored when a metal wire is extended by a force?

..... [1]

- (b) A metal wire of length 1.2m is clamped vertically. A weight is hung from the lower end of the wire. The extension of the wire is 0.35mm. The cross-sectional area of the wire is $1.4 \times 10^{-7} \text{ m}^2$ and the Young modulus of the metal is $1.9 \times 10^{11} \text{ Pa}$.

Calculate

- (i) the strain of the wire

strain = [1]

- (ii) the tension in the wire.

tension = N [2]

Question 7 is continued over the page.

Turn over

(c) There is great excitement at the moment about structures known as carbon nanotubes (CNTs). CNTs are cylindrical tubes of carbon atoms. These cylindrical tubes have diameter of a few nanometres and can be several millimetres in length. Carbon nanotubes are one of the strongest and stiffest materials known. Recently a carbon nanotube was tested to have an ultimate tensile strength of about 60 GPa. In comparison, high-carbon steel has an ultimate tensile strength of about 1.2 GPa. Under excessive tensile stress, the carbon nanotubes undergo plastic deformation. This deformation begins at a strain of about 5%. Carbon nanotubes have a low density for a solid. Carbon nanotubes have recently been used in high-quality racing bicycles.

(i) 1 The diameter of CNTs is a *few nanometres*. What is one nanometre in metres?

..... [1]

2 Explain what is meant by *plastic deformation*.

.....
.....
..... [1]

(ii) How many times stronger are CNTs than high-carbon steel?

.....
..... [1]

(iii) State two advantages of making a bicycle frame using CNT technology rather than high-carbon steel.

- 4 A dart is thrown horizontally at a speed of 8.0 m s^{-1} towards the centre of a dartboard that is 2.0 m away. At the same instant that the dart is released, the support holding the dartboard fails and the dartboard falls freely, vertically downwards. The dart hits the dartboard in the centre before they both reach the ground.

- (a) State and explain the motion of the dart and the dartboard, while the dart is in flight.

You may be awarded additional marks to those shown in brackets for the quality of written communication in your answer.

.....

.....

.....

.....

.....

.....

(4 marks)

- (b) Calculate

- (i) the time taken for the dart to hit the dartboard,

.....

.....

- (ii) the vertical component of the dart's velocity just before it strikes the dartboard,

.....

.....

- (iii) the magnitude and direction of the resultant velocity of the dart as it strikes the dartboard.

.....

.....

.....

.....

(5 marks)

- 5 An aircraft accelerates horizontally from rest and takes off when its speed is 82 m s^{-1} . The mass of the aircraft is $5.6 \times 10^4 \text{ kg}$ and its engines provide a constant thrust of $1.9 \times 10^5 \text{ N}$.

(a) Calculate

- (i) the initial acceleration of the aircraft,

.....

- (ii) the minimum length of runway required, assuming the acceleration is constant.

.....

(3 marks)

- (b) In practice, the acceleration is unlikely to be constant. State a reason for this and explain what effect this will have on the minimum length of runway required.

.....

(2 marks)

- (c) After taking off, the aircraft climbs at an angle of 22° to the ground. The thrust from the engines remains at $1.9 \times 10^5 \text{ N}$. Calculate

- (i) the horizontal component of the thrust,

.....

- (ii) the vertical component of the thrust.

2

1

Answer **all** the questions.

- 1 (a) Draw a line from each unit on the left-hand side to the correct equivalent unit on the right-hand side.

joule (J)	kg m s^{-2}
watt (W)	N m
newton (N)	J s^{-1}

[2]

- (b) This question is about estimating the pressure exerted by a person wearing shoes standing on a floor, see Fig. 1.1.

Fig. 1.1

- (i) Estimate the weight in newtons of a person.

weight = N [1]

2

- (ii) Estimate the total area of contact in square metres between the shoes of this person and the floor.

area = m² [1]

- (iii) Hence estimate the pressure in pascals exerted by this person standing on the floor.

pressure = Pa [1]

[Total: 5]

3

- 2 Fig. 2.1 shows two masses **A** and **B** tied to the ends of a length of string. The string passes over a pulley. The mass **A** is held at rest on the floor.

Fig. 2.1

The mass **A** is 1.20 kg and the mass **B** is 1.50 kg.

- (a) Calculate the weight of mass **B**.

weight = N [1]

- (b) Mass **B** is initially at rest at a height of 2.80 m above the floor. Mass **A** is then released. Mass **B** has a constant downward acceleration of 1.09 m s^{-2} . Assume that air resistance and the friction between the pulley and the string are negligible.

- (i) In terms of forces, explain why the acceleration of the mass **B** is less than the acceleration of free fall g .

.....

..... [1]

- (ii) Calculate the time taken for the mass **B** to fall 1.40 m.

time = s [3]

4

- (iii) Calculate the velocity of mass **B** after falling 1.40 m.

velocity = ms^{-1} [2]

- (iv) Mass **B** hits the floor at a speed of 2.47 ms^{-1} . It **rebounds** with a speed of 1.50 ms^{-1} . The time of contact with the floor is $3.0 \times 10^{-2} \text{ s}$. Calculate the magnitude of the average acceleration of mass **B** during its impact with the floor.

acceleration = ms^{-2} [2]

[Total: 9]

5

- 3 A lift has a mass of 500 kg. It is designed to carry a maximum of 8 people of total mass 560 kg. The lift is supported by a steel cable of cross-sectional area $3.8 \times 10^{-4} \text{ m}^2$. When the lift is at ground floor level the cable is at its maximum length of 140 m, as shown in Fig. 3.1. The mass per unit length of the cable is 3.0 kg m^{-1} .

Fig. 3.1

- (a) Show that the mass of the 140 m long steel cable is 420 kg.

[1]

6

- (b) (i) The lift with its 8 passengers is stationary at the ground floor level. The initial upward acceleration of the lift and the cable is 1.8 ms^{-2} . Show that the **maximum** tension in the cable at point **P** is $1.7 \times 10^4 \text{ N}$.

[4]

- (ii) Calculate the maximum stress in the cable.

stress = Pa [2]

[Total: 7]

Turn over

- 4 (a) An electron in a particle accelerator experiences a constant force. According to one student, the acceleration of the electron should remain constant because the ratio of force to mass does not change. In reality, experiments show that the acceleration of the electron decreases as its velocity increases. Describe what can be deduced from such experiments about the nature of accelerated electrons.

.....

 [2]

- (b) Fig. 4.1 shows the velocity vector for a particle moving at an angle of 31° to the horizontal.

Fig. 4.1

- (i) On Fig. 4.1, show the horizontal (x -direction) and vertical (y -direction) components of the velocity. [2]
- (ii) Calculate the horizontal (x -direction) component of the velocity.

velocity = ms^{-1} [1]

(c) Fig. 4.2 shows a ship **S** being pulled by two tug-boats.

Fig. 4.2

The ship is travelling at a constant velocity. The tensions in the cables and the angles made by these cables to the direction in which the ship travels are shown in Fig. 4.2.

(i) Draw a vector triangle and determine the resultant force provided by the two cables.

resultant force = kN [3]

(ii) State the value of the drag force acting on the ship **S**. Explain your answer.

.....

 [2]

[Total: 10]

Turn over

- 5 (a) State the principle of conservation of energy.

.....
 [1]

- (b) Describe one example where elastic potential energy is stored.

..... [1]

- (c) Fig. 5.1 shows a simple pendulum with a metal ball attached to the end of a string.

Fig. 5.1

When the ball is released from **P**, it describes a circular path. The ball has a maximum speed v at the bottom of its swing. The vertical distance between **P** and bottom of the swing is h . The mass of the ball is m .

- (i) Write the equations for the change in gravitational potential energy, E_p , of the ball as it drops through the height h and for the kinetic energy, E_k , of the ball at the bottom of its swing when travelling at speed v .

$$E_p =$$

$$E_k =$$

[1]

- (ii) Use the principle of conservation of energy to derive an equation for the speed v . Assume that there are no energy losses due to air resistance.

[2]

- (d) Some countries in the world have frequent thunderstorms. A group of scientists plan to use the energy from the falling rain to generate electricity. A typical thunderstorm deposits rain to a depth of $1.2 \times 10^{-2} \text{ m}$ over a surface area of $2.0 \times 10^7 \text{ m}^2$ during a time of 900 s. The rain falls from an average height of $2.5 \times 10^3 \text{ m}$. The density of rainwater is $1.0 \times 10^3 \text{ kg m}^{-3}$. About 30% of the gravitational potential energy of the rain can be converted into electrical energy at the ground.

- (i) Show that the total mass of water deposited in 900 s is $2.4 \times 10^8 \text{ kg}$.

[2]

- (ii) Hence show that the average electrical power available from this thunderstorm is about 2 GW.

[3]

- (iii) Suggest one problem with this scheme of energy production.

1

Answer **all** the questions.

- 1 (a) Draw a straight line from each quantity on the left hand side to its correct unit on the right hand side; one has already been done for you.

velocity	Nm^{-2}
work done	ms^{-1}
stress	Nm
density	kg m^{-3}

[2]

- (b) Fig. 1.1 shows a metal cube which rests on a table.

Fig. 1.1

The mass of the metal cube is 4.8 kg. Each side of the cube has length 0.085 m. The cube exerts pressure on the table.

- (i) Complete the sentence below:

The force acting on the table is due to the of the metal cube. [1]

- (ii) Calculate the pressure exerted on the table by the metal cube.

pressure = Pa [2]

2

- (iii) The metal cube shown is replaced by a second cube made of the same material but with each side of double the length of the original cube.

Complete the sentences below for the second cube when compared with the original cube.

The mass of the second cube is times greater than the original cube.

The cross-sectional area of the base is times greater than the original cube.

Hence, the pressure exerted by this cube is times greater than the original cube.

- 2 A driver travelling in a car on a straight and level road sees an obstacle in the road ahead and applies the brakes until the car stops. The initial speed of the car is 20 m s^{-1} . The reaction time of the driver is 0.50 s.

Fig. 2.1 shows the velocity against time graph for the car.

Fig. 2.1

- (a) Define *thinking distance*.

.....
 [1]

- (b) What does the area under a velocity against time graph represent?

..... [1]

- (c) Use your answer to (b) and Fig. 2.1 to determine

- (i) the thinking distance

thinking distance = m [1]

- (ii) the braking distance.

braking distance = m [2]

- (d) The total mass of the car is 910 kg. Use Fig. 2.1 to determine

- (i) the magnitude of the deceleration of the car

deceleration = ms^{-2} [2]

- (ii) the braking force acting on the car as it decelerates.

force = N [2]

- (e) Suppose the initial speed of the car is twice that shown in Fig. 2.1. The braking force remains the same. State and explain by what factor the **braking** distance would increase.

- 3 (a) Define *work done* by a force.

.....
 [1]

- (b) Fig. 3.1 shows a car travelling up a slope at a constant speed.

Fig. 3.1

The angle between the slope and the horizontal is 7.0° . The weight of the car is $9.0 \times 10^3 \text{ N}$. The car travels up the slope at a constant speed of 18 ms^{-1} . A resistive force of 300 N acts on the car down the slope.

- (i) What is the net force acting on the car? Explain your answer.

.....

 [2]

- (ii) Calculate the component of the weight of the car acting down the slope.

component of weight = N [2]

Turn over

7

- (iii) Calculate the work done per second against the resistive force.

work done per second = Js^{-1} [1]

- (iv) Calculate the power developed by the car as it travels up the slope.

power = W [3]

[Total: 9]

- 4 (a) Write a word equation for *kinetic energy*.

kinetic energy =

[1]

- (b) A bullet of mass $3.0 \times 10^{-2} \text{ kg}$ is fired at a sheet of plastic of thickness 0.015 m . The bullet enters the plastic with a speed of 200 m s^{-1} and emerges from the other side with a speed of 50 m s^{-1} .

Calculate

- (i) the loss of kinetic energy of the bullet as it passes through the plastic

loss of kinetic energy = J [3]

- (ii) the average frictional force exerted by the plastic on the bullet.

frictional force = N [2]

- 5 Use your knowledge of physics to state if each statement is correct or incorrect. You then need to explain the reason for your answer. An example has been done for you:

In a vacuum, a 2.0 kg object will fall faster towards the ground than an object of mass 1.0 kg.

This statement is **incorrect**.

Explanation: **All objects falling towards the Earth in a vacuum have the same acceleration.**

- (a) The mass of a particle (e.g. electron) remains constant as its speed approaches the speed of light.

This statement is

Explanation:

.....

..... [2]

- (b) A ball is thrown vertically upwards. Air resistance has negligible effect on its motion. During the flight, the total energy of the ball remains constant.

This statement is

Explanation:

.....

..... [2]

- (c) An object falling through air has a terminal velocity of 30 m s^{-1} . At terminal velocity, the weight of the object is equal to the acceleration of free fall.

This statement is

Explanation:

.....

..... [2]

- (d) The technique of 'triangle of vectors' is used by a global positioning system (GPS) to locate the position of cars.

In your answer, you should use appropriate technical terms, spelled correctly.

This statement is

Explanation:

.....

..... [2]

Please turnover for Question 8.

Turn over

- 8 A small block of wood is held at a horizontal distance of 1.2 m from a metal ball. The metal ball is fired horizontally towards the block at a speed of 8.0 m s^{-1} . At the same instant the ball is fired, the block is released and it falls vertically under gravity.

Fig. 8.1 shows the paths of the metal ball and the block. The ball collides with the block. Air resistance is negligible.

Fig. 8.1

- (a) Show that the time between firing the ball and it colliding with the block is 0.15 s.

[1]

- (b) Calculate the vertical distance h fallen by the wooden block when it collides with the metal ball.

$h = \dots\dots\dots \text{ m}$ [2]

14

- (c) Briefly explain why the metal ball will always collide with the wood block, even if the speed of the ball or the horizontal distance is changed.
